SYSTEM_CORE: V. 1.0.0
STATUS: SYS_READY

DIAGNOSTICS 75%

INTEGRITY CHECK: PASS

SYSTEM CLASSIFICATION: TOP SECRET

. MACRO-ARCHITECTURE & ECONOMIC PARADIGM

CORE INFRASTRUCTURE

> The TCG Exchange is not a standard retail simulation; it is a fully decentralized, multi-tenant algorithmic micro-economy.

- Legacy B2C (Business-to-Consumer) monoliths logically collapse when subjected to the project's absolute operational directive: "Every user must be empowered to add a product or service." To resolve this architectural paradox, we engineered a Peer-to-Peer (P2P) trading matrix. We eradicated the archaic boundary between "Merchant" and "Consumer." Within this ecosystem, every authenticated entity operates as an autonomous economic node, possessing dual-state privileges to both manipulate global supply (inventory) and execute demand (purchasing).

- The system governs a globally seeded data matrix of over 14,000 unique cryptographic assets, facilitating zero-latency peer-to-peer negotiations, secure financial routing, and highly deterministic deck-building algorithms.

SYSTEM CLASSIFICATION: TOP SECRET

ARCHITECTURE & ADVERSARIAL DEFENSE

CORE INFRASTRUCTURE

> The kernel operates on a strict Model-View-Controller (MVC) topology, guaranteeing total separation of concerns and high-velocity code maintainability.

- **THE DATA LAYER (STRICT 3NF NORMALIZATION)**

  We deployed Laravel's Eloquent ORM to interface with a highly normalized, zero-redundancy MySQL schema. Referential integrity is absolute, enforced via database-level foreign keys with cascading deletions, mathematically preventing orphaned records or ghost data.

- **THE PRESENTATION LAYER (ZERO-BLOAT SSR)**

  To adhere to strict constraints prohibiting heavy frontend frameworks, the user interface (dubbed 'Neon Bauhaus') utilizes Server-Side Rendering (SSR) combined with pure Vanilla JavaScript and Custom CSS. This results in ultra-low latency DOM mutations, bypassing the performance bottlenecks of modern SPA (Single Page Application) frameworks while maintaining deep asynchronous interactivity.

- **STATE MANAGEMENT & ATOMIC TRANSACTIONS**

  Checkout pipelines (OrderController) are fortified by ACID-Compliant Atomic Commits (DB::beginTransaction()). If a race condition, inventory discrepancy, or server fault occurs mid-checkout, the entire transaction triggers an idempotent rollback. Partial data corruption is mathematically impossible.

- **ADVERSARIAL DEFENSE (THE ZERO-TRUST PERIMETER)**

  Operating on a strict Zero-Trust philosophy, raw HTTP payloads are treated as hostile. Proprietary FormRequests intercept all incoming data. These heuristic shields mathematically neutralize Cross-Site Scripting (XSS) and SQL Injection vectors before controller execution. Route-level access is governed by an airtight RoleMiddleware, structurally isolating administrative execution environments from standard user routing.

SYSTEM CLASSIFICATION: TOP SECRET

OPERATIONAL DIRECTIVES

PROJECT SPECIFICATION COMPLIANCE

> The system systematically fulfills and eclipses all functional parameters dictated by the academic brief:

- **A. AUTHENTICATION**

  Fortified cryptographic login, session tokenization, and a highly secure Profile Management terminal utilizing Laravel's core auth scaffolding.

- **B. PRODUCTS/SERVICES**

  Users possess full CRUD (Create, Read, Update, Delete) authority over their inventory nodes. Listings enforce strict schema definitions: Title, Description, Price, Condition, Quantity, and binary image uploads.

- **C. CATALOG**

  A public-facing data matrix driven by optimized Eloquent querying. It supports instantaneous keyword targeting, strict Category isolation, and algorithmic parameter Sorting (Price matrices, A-Z).

- **D. SHOPPING CART**

  An ephemeral, session-based state machine engineered for dynamic quantity mutations and algorithmic recalculations prior to database execution.

- **E. ORDER LEDGER**

  A secure, multi-vendor transaction pipeline. The database structurally enforces the exact mandated status enumerations (Pending, Validated, Cancelled). Both counterparties maintain dedicated UI dashboards with real-time state tracking.

- **F. PEER REVIEWS**

  Post-transaction (upon reaching a Validated state), the ecosystem unlocks a 1-5 star heuristic rating system. This data recursively aggregates to recalculate a seller's global reputation index.

SYSTEM CLASSIFICATION: TOP SECRET

ARCHITECTURE & ADVERSARIAL DEFENSE

CORE INFRASTRUCTURE

Advanced Layer 3 Specifications Achieved:

- **MULTI-VENDOR ARCHITECTURE**

  The relational schema natively supports a theoretically infinite array of independent merchants operating concurrently within a single transaction cycle.

- **PEER-TO-PEER (P2P) MESSAGING**

  "Duelist Comm"—a real-time P2P negotiation terminal. Built utilizing AJAX Exponential Backoff polling, it facilitates seamless, asynchronous data streams bypassing HTTP page reloads entirely.

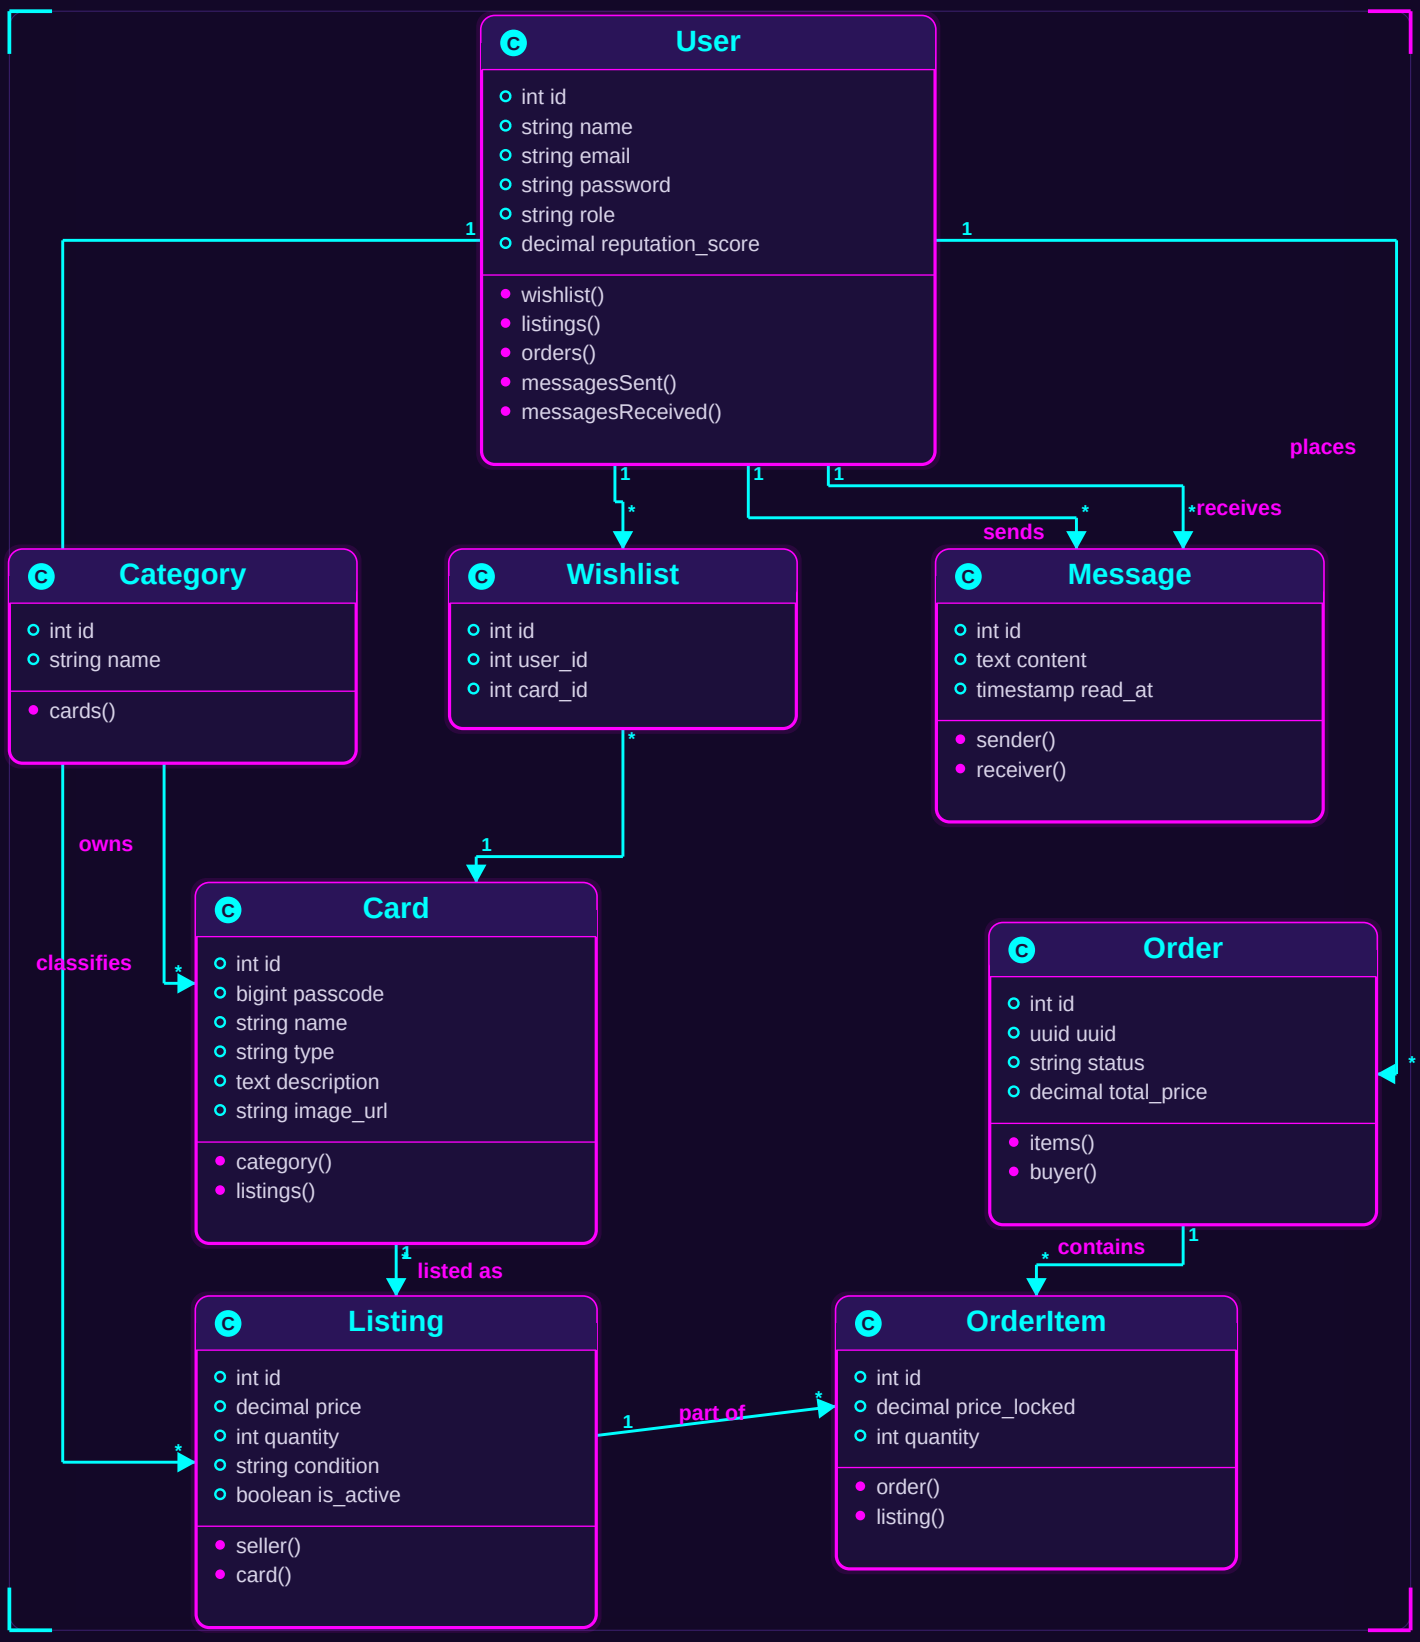
- **ROLE-BASED ACCESS CONTROL (RBAC)**

  Application-wide security governed by custom RoleMiddleware, granting absolute binary access privileges (Administrator vs. Standard User).

UML CLASS DIAGRAM

DATA MODEL

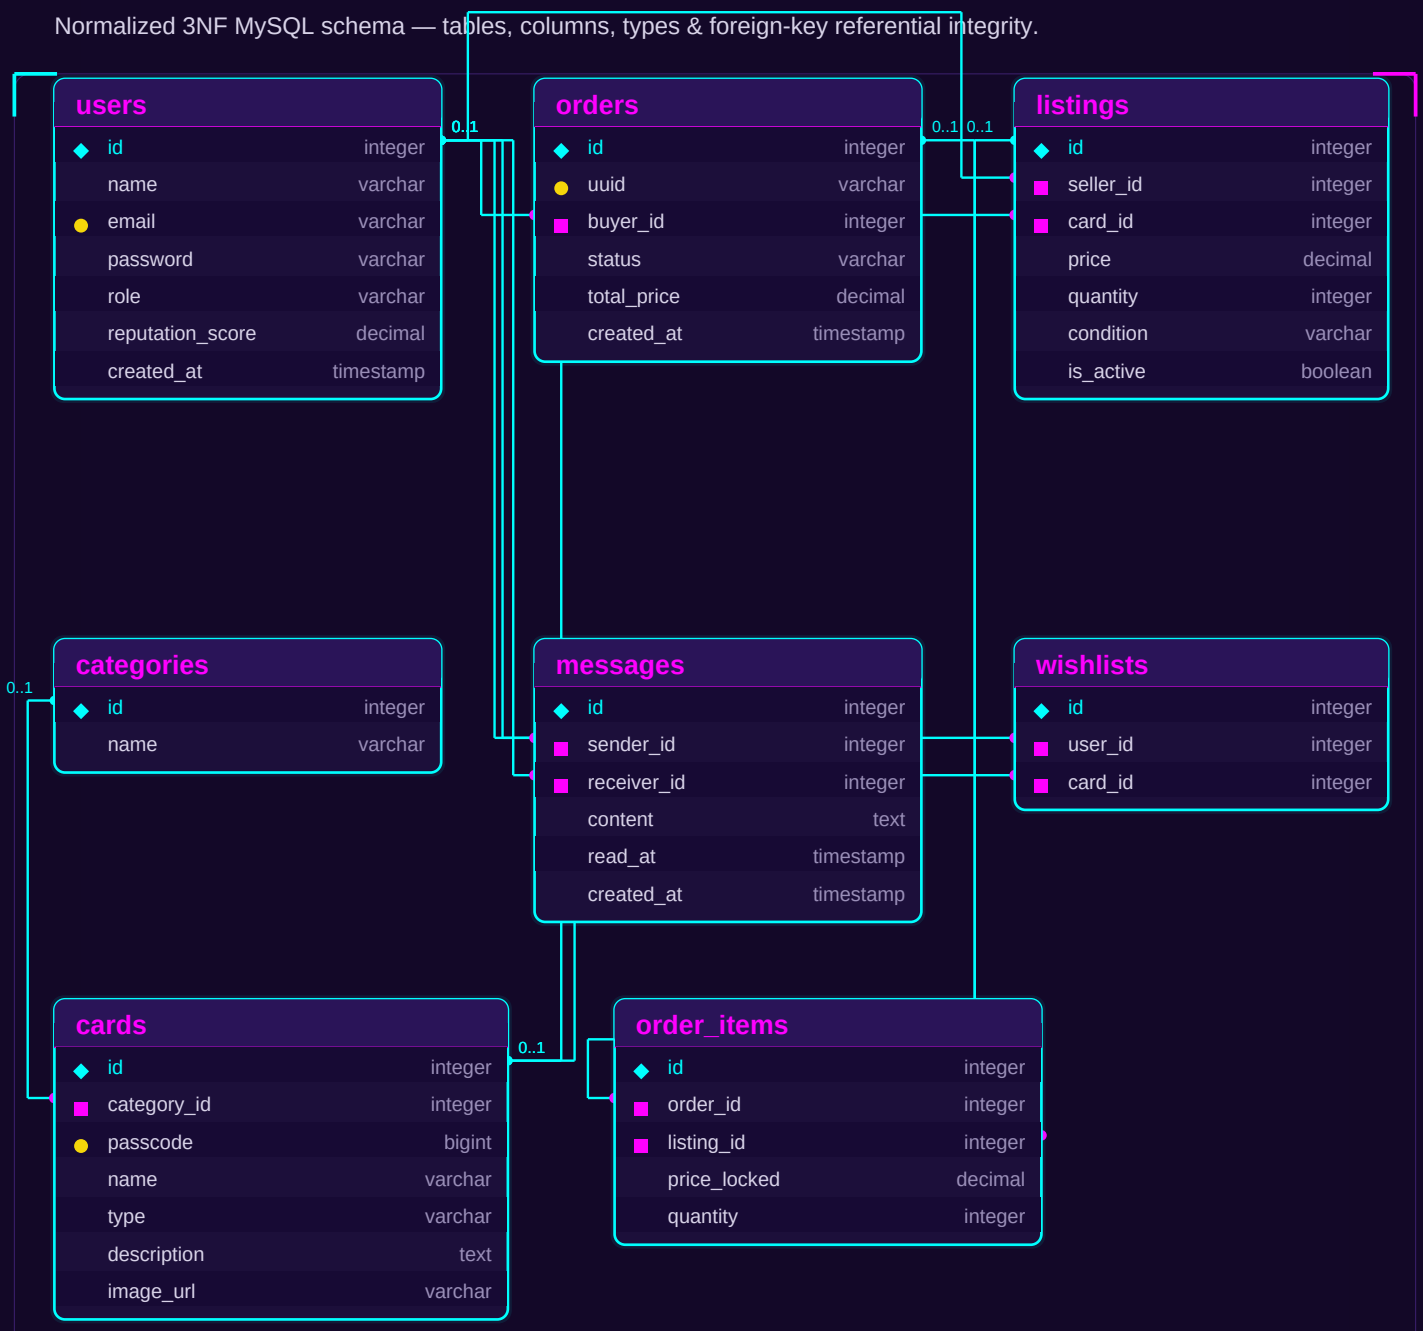
Static object-oriented model of The TCG Exchange — classes, attributes & associations.



DATABASE SCHEMA

RELATIONAL TOPOLOGY

Normalized 3NF MySQL schema — tables, columns, types & foreign-key referential integrity.



LEGEND ◆ Primary Key ■ Foreign Key ● Unique —●— FK Relationship (0..1 → N)

> 8 tables | 10 foreign-key constraints | cascading deletes enforced at DB level
> Engine: MySQL InnoDB | Charset: utf8mb4 | Referential integrity: STRICT
